| project Name | Educational organization using ServiceNow |

| Problem                                                                               | Proposed Solution Feature                                                                                                  | How it Solves the Problem                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Problem 1:</b> Data entry is slow and repetitive (e.g., addresses, student names). | 1. <b>"Pincode Update" Client Script</b><br><br>2. <b>"Auto Populate" Client Script</b>                                    | 1. Entering a pincode automatically fills in City, Mandal, and District, saving time.<br><br>2. Selecting an Admission Number on the progress form auto-fills all student details, eliminating re-typing. |
| <b>Problem 2:</b> Manual calculation of student marks is slow and error-prone.        | 1. <b>"Total Update" Client Script</b><br><br>2. <b>"Percentage" Client Script</b><br><br>3. <b>"Result" Client Script</b> | 1, 2, 3. The system instantly and accurately performs all calculations as the user enters marks, providing immediate feedback and ensuring 100% accuracy.                                                 |
| <b>Problem 3:</b> Calculation fields (Total, Result) can be edited                    | <b>"Disable Fields" onLoad Client Script</b>                                                                               | This script makes the calculation fields read-only the moment the form loads,                                                                                                                             |

| Problem                                                                       | Proposed Solution Feature                   | How it Solves the Problem                                                                                                                              |
|-------------------------------------------------------------------------------|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| by users, compromising data integrity.                                        |                                             | forcing users to rely on the automated calculations.                                                                                                   |
| <b>Problem 4:</b> It's difficult to know the status of a student's admission. | <b>Process Flow on Admission Table</b>      | A simple, visual bar at the top of the form clearly shows which stage the admission is in (e.g., "New," "In Progress," "Joined").                      |
| <b>Problem 5:</b> Forms are a long, unorganized list of fields.               | <b>Form Design (Sections &amp; Columns)</b> | Fields are grouped into logical sections ("Address," "Student Progress") and arranged in two columns, making the forms much easier and faster to read. |
