Problem-Solution Fit Template

Date	November 2, 2025
Team ID	F53C03230D9D3649CD4402B24FF15FEB
project Name	Educational organization using ServiceNow

Problem	Proposed Solution Feature	How it Solves the Problem
Problem 1: Data entry is slow and repetitive (e.g., addresses, student names).	1. "Pincode Update" Client Script 2. "Auto Populate" Client Script	1. Entering a pincode automatically fills in City, Mandal, and District, saving time. 2. Selecting an Admission Number on the progress form auto-fills all student details, eliminating re-typing.
Problem 2: Manual calculation of student marks is slow and error-prone.	1. "Total Update" Client Script 2. "Percentage" Client Script 3. "Result" Client Script	1, 2, 3. The system instantly and accurately performs all calculations as the user enters marks, providing immediate feedback and ensuring 100% accuracy.
Problem 3: Calculation fields (Total, Result) can be edited	"Disable Fields" onLoad Client Script	This script makes the calculation fields read-only the moment the form loads,

by users, compromising data integrity.		forcing users to rely on the automated calculations.
Problem 4: It's difficult to know the status of a student's admission.	Process Flow on Admission Table	A simple, visual bar at the top of the form clearly shows which stage the admission is in (e.g., "New," "In Progress," "Joined").
Problem 5: Forms are a long, unorganized list of fields.	Form Design (Sections & Columns)	Fields are grouped into logical sections ("Address," "Student Progress") and arranged in two columns, making the forms much easier and faster to read.
